

## Rycom 8856

The 8856 features both high (82 kHz) and low (815 Hz) frequencies for inductive locating capability and maximum flexibility. Special filtering makes it possible to locate in and around power lines without interference, and the variable pitch audio tone provides better indication of the target path. The signal is easily picked up with the receiver at waist height no bending over. For convenience and ease of use, the 8856 is one of the best pipe & cable locator values available anywhere.

Includes: receiver, transmitter, operating manual, batteries, ground stake and all necessary cables.
